### The basic steps include:

1. Remove the old strings from your guitar.
2. Unscrew and remove the pickguard and carefully turn it over taking care not to scratch your guitar's finish.
3. De-solder the original pickup's wires and make sure to remember where they were connected.
4. Remove the original pickup from the pickguard.
5. Put the Seymour Duncan pickup into the pickguard.
6. First tin and then solder the Seymour Duncan pickup wires in the same spot the original pickup's wires were connected.
7. Put the pickguard back in place, taking care to tuck in loose wires.
8. Re-string your guitar and adjust the pickup height so that your new pickup balances with the other pickups in the guitar. The bridge pickup should be between 1/8" and 1/16" from the strings, when they are pressed down at the highest fret, and the neck and middle pickups should be adjusted to achieve the best balance with the bridge pickup.

### Coil Splitting

for additional wiring diagrams.

Strat and Fender are registered trademarks of FMIC, with which Seymour Duncan is not affiliated.

If two pickups sound thin and nasal when used together, chances are, they're out of phase with each other. If you're combining your Seymour Duncan pickup(s) with Fender® pickup(s) in the same guitar, you'll need to reverse the black and green wires on the Seymour Duncan. In other words, solder the black wire to ground and the green wire to the selector switch.
